Custom Software & Product Systems Developer

Product Configurators & CPQ · Technical Implementation · Business-to-Software Translation · Unity/C# · AI-Assisted Workflows

SUMMARY

Product systems developer who builds configurable-product tools and translates business needs into working software. Designed and ran a production Unity configurator — a custom configure-price-quote (CPQ) system — that supported 10,000+ quote, order, and rent-to-own records and millions of dollars in sales for a commercial shed retailer from 2012 to 2022. Earlier work as the technical-to-business bridge at a marketing agency spanned 40–60 client accounts, from small businesses to multimillion-dollar companies. Current work centers on Unity/C# development, Python tooling, and practical AI-assisted technical workflows.

CORE SKILLS

Product configurators & CPQ: product rules, pricing logic, quote and order generation, rent-to-own and financing paths, customer and staff tools

Development & integration: Unity/C#, 3D product visualization, business-system integration (Drupal/PHP), debugging, technical documentation

Quality & review: testing, code review, source verification, technical documentation, and review of AI-generated work

EXPERIENCE

Independent Developer | Technical Systems Projects | 2025 to Present

- Building software and tooling with AI-assisted workflows across Unity/C#, Python, and text-analysis projects — using AI for planning, code review, and debugging while keeping the output verified and inspectable.
- Developing StaffSight, a Unity/C# Android prototype for music practice and pitch visualization, with song and part selection, review timelines, and notation display.

3D Customizer | Sole Proprietor and Product Systems Developer | 2015 to 2022

- Ran an independent product-configuration business (acquired from a prior employer's customization division), handling development, client support, vendor coordination, and day-to-day operations.
- Built and ran the underlying Unity/WebGL configurator — a custom CPQ system — linking visual product configuration to live pricing, generated drawings, quote and order paths, and rent-to-own financing.
- Built the Unity-to-Drupal/PHP integration that turned customer selections into pricing, auto-generated quote and order PDFs, and staff-ready production documents.
- Worked directly with the business owner, sales staff, and end users over a decade of live use, translating their feedback and reported issues into product changes.

Quessity | Technical Implementation and Product Systems Developer | 2011 to 2015

- Began in web development (PHP, JavaScript, Drupal) on commercial client sites, then moved into building custom product configurators in Unity for sheds, playsets, and fencing.
- Acted as the technical-to-business translator across 40–60 agency client accounts — from small businesses to multimillion-dollar companies — joining owner and client meetings and turning business and sales requirements into feasible software.
- Built the Unity/Vuforia mobile AR catalog for Fence Experts / BOOST, turning a printed fence brochure into interactive 3D product views for sales conversations.

SELECTED PORTFOLIO PROJECTS

- [3D Shed Customizer](#): production CPQ configurator case study — screenshots, generated quote outputs, a workflow video, and data-flow diagrams.
- [Fence Experts / BOOST AR Catalog](#): Unity/Vuforia mobile app turning a printed fence brochure into interactive 3D product views.

SKILLS & TOOLS

Domain background: Construction, sales, warehouse management, and B2B marketing — practical context for building software around configurable products, pricing, quotes, staff tools, and real business operations.

Tools: C#, Python, Unity, Unity WebGL, VS Code, Git/GitHub · AI-assisted development: Claude Code, ChatGPT, Codex, Gemini · Prior/familiar: PHP, JavaScript, Drupal
