Custom Software & Product Systems Developer

Product configurators & custom CPQ | Unity/C# tools | quote/order & rent-to-own workflows | implementation support

SUMMARY

Custom software and product-systems developer who builds practical tools where product rules, pricing, documents, and staff workflows all stay connected. Built and maintained a production Unity/WebGL configurator and custom CPQ system supporting thousands of quote, order, and rent-to-own records tied to millions of dollars in shed sales. Now builds and governs AI-assisted workflows that keep output grounded in evidence and under human control, alongside ongoing Unity/C# and Python work.

SKILLS

Development: Unity/C#, Unity WebGL, JavaScript, PHP, Python, Drupal/PHP, Drupal/Ubercart, Git/GitHub

Product & workflow systems: product configurators, custom CPQ, pricing logic, quote/order/rent-to-own workflows, sales-process automation, backend/workflow integrations, generated elevation/floor-plan outputs, staff/shop handoff

Practice & delivery: stakeholder translation, technical documentation, diagnostics, validation checks, source-grounded review, AI-assisted review workflows, configurable physical-product workflows, small-business systems, troubleshooting

PROFESSIONAL EXPERIENCE

Independent Developer

2025–Present

Technical Projects & AI-Assisted Workflows

- Build software using AI as a core working tool across planning, development, review, and analysis, and design the surrounding workflow so its output stays inspectable and is checked before it's used.
- Work in Unity/C# and Python on current projects, kept version-controlled and documented (Git/GitHub).

Career Break (Health & Well-Being)

2022–2025

Health-related break; returned to active technical work in 2025.

3D Customizer

2015–2022

Sole Proprietor & Product Systems Developer

- Acquired and ran 3D Customizer as a commercially active business, managing product development, client support, troubleshooting, vendor coordination, and ongoing implementation.
- Operated and expanded a production Unity/WebGL configurator and custom CPQ system originally built during the Quessity period; across its full 2012–2022 lifecycle it supported thousands of quote, order, and rent-to-own records tied to millions of dollars in shed sales.
- Built and maintained the configurator and CPQ layer, connecting visual shed and coop configuration to product rules, option logic, live pricing, generated elevations/floor plans, and quote/order/rent-to-own paths. Integrated it with Drupal/PHP pricing feeds, delivery/tax estimates, generated drawings, PDFs, and customer/staff/shop handoff.
- Worked directly with business owners, sales staff, and users to resolve issues, refine features, and adapt the system as sales and operational needs changed.

Quessity

2011–2015

Technical Implementation & Product Systems Developer

- Began in web development on commercial client sites (PHP, JavaScript, Drupal), then moved into building custom product configurators in Unity for playsets, sheds, fences, and related configurable products.
- Acted as the main technical-to-business contact across 40–60 agency client accounts, from small businesses to multimillion-dollar companies, translating product and sales requirements into feasible tools and implementation steps.
- Built the app-side Unity/Vuforia AR catalog for the Fence Experts / BOOST Reality sales-support app.
- Supported small-business web and client systems through Drupal/admin updates, PHP and JavaScript fixes, website changes, workflow troubleshooting, and technical support; coordinated with owners, clients, designers, and technical contributors.

SELECTED PROJECTS

Fence Experts / BOOST AR Catalog. 2013 Unity/Vuforia mobile AR sales tool. Built the app-side scenes, AR image-target setup, mobile UI and interaction logic, and 3D fence/product models that turned a printed catalog into interactive 3D product views for sales conversations.

StaffSight. Unity/C# Android music-practice prototype (active). Live pitch visualization, song/part selection, review timelines, diagnostics, and MusicXML-based notation, built with documented, AI-assisted iteration.

Governed AI Workflows. Python method that turns long-form talks into verifiable, source-traced findings. Across a 153-talk corpus, it extracts advice and predictions and traces each one back to its exact source words. Findings are scored against pre-registered controls that included planted decoys it had to reject, and every kept finding goes through mandatory human review.
